

POSSIBLE COMPLICATION OF FACIAL AUGMENTATION
LIPS, FACIAL GROOVES, DEPRESSIONS

INFECTION & NEED TO REMOVE IMPLANT MATERIAL - Infection of the implant is possible but very rare, 1% or less. If infection occurs and is unresponsive to antibiotic treatment; removal of the implant is recommend. A new implant can be placed again after 3-4 months.

BLEEDING -Bleeding requiring intervention is less than 1 %.

ASYMMERTY OR IRREGULARITY -Generally these resolve over weeks to occasionally months. If they do not, revision will be required to correct the problem.

NERVE INJURY - Temporary numbness is the rule lasting days to weeks and rarely months.

POOR SCARRING -Anytime an incision is made an undesirable scar can occur. However, this is rare with this type of procedure. If it should occur I will do everything possible to correct it.

LIMITED RESULTS -I attempt to communicate realistic results based on the available technique(s) we discussed. If the final result did not meet our mutual expectations revision surgery can be performed provided there is a high probability that improvement can be achieved.

NEED FOR REVISION SURGERY -As discussed above revision surgery is occasionally needed and advised. If a revision procedure is performed fees will be based on the extent of the procedure.
